

The BitmapDataCounter module defines when the BitmapPixelData module needs to load a fresh byte of data from the bitmap data bus

To do calculate when to load the module needs to run a separate counter clocked off the same source as the main pixel counter

The ViewPort module contains a trigger to start the counter out of phase with the data boundary so the data is correctly loaded in advance. Note this does not trigger the memory access, that requires another trigger event in another phase so that the data bus can be prepared before the load action takes place

The number of clock ticks per pixel and bits per pixel both impact how frequently the load signal fires. In this simplified design the faster timing options are not used but can be implemented from this design if needed
